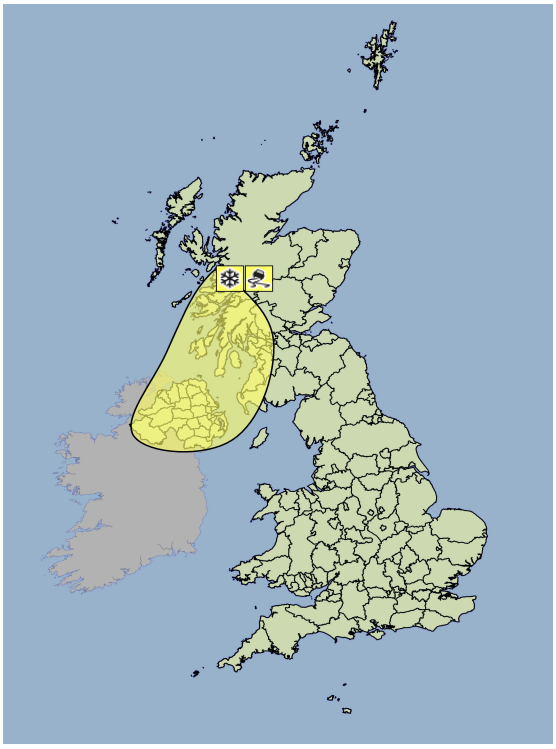
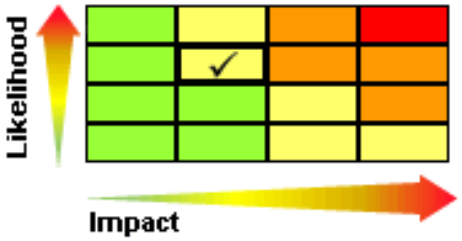
National Severe Weather Warning Service





Chief Forecasters Assessment
A complex frontal system is edging into the UK from the west and is coming up against a stagnant cold airmass ahead of it. Rain arriving in westernmost areas will turn to sleet and snow in places as it comes inland later on Tuesday, more particularly on higher ground, but will gradually due out overnight as the front weakens. Icy stretches are likely to form as cloud breaks develop, allowing temperatures to fall.

The Met Office have issued a **Yellow Warning** of **Snow and Ice**

Valid from **17:00 on Tue, 20th Jan 2015** until **10:00 on Wed, 21st Jan 2015**

Outbreaks of mostly light rain and sleet on Tuesday evening, with snow across higher parts of Northern Ireland and inland parts of western Scotland, will gradually die out overnight. Snow accumulations of only 1 to 2 cm expected but locally 5 cm is possible over the higher ground of Argyll. In addition, icy stretches will form on untreated surfaces.

The public should be aware of the risk of difficult travel conditions.
